

SYSTEM AND METHODS OF
UPDATING COMPACT DISCS AND
GRAPHICAL USER INTERFACE FOR UPDATING SAME

Field of the Invention

The present invention relates to the field of multimedia, computers, and multimedia system, and, more particularly, to data storage and compact discs.

5

Background of the Invention

Over the years, computers have developed to bring tremendous changes to technology, company operations, and various aspects of personal and work lives of individuals. With the widespread advent of computers, multimedia has developed to communicate information, entertain, archive information, and provide information to users of computers and other multimedia systems. Relatively recently, compact discs have been developed for storing and retrieving large amounts of information or data when desired to be accessed by users. Magnetic compact discs, i.e., floppy discs, having a rectangular shape were first developed, and custom magnetic disc readers soon became a standard on many computers. Because of the ability to store even larger amounts of digital data, annular-shaped optical compact discs soon became a standard for storing information such as new software programs. The sizes of these annular-shaped

10
15
20

compact discs were about 120 mm, and later 80 mm annular-shaped compact discs were developed.

Accordingly, computers and other hardware had optical compact discs as standard equipment for loading

5 software and storing and retrieving other data for users. One of the problems with optical compact discs, however, is that these discs are a type of read-only memory ("ROM") or CD-ROM. In other words, for years it was not possible to write new information to the disc.
10 Accordingly, magnetic compact discs did not and have not yet become obsolete. The cost effective manufacturing and widespread distribution of the CD-ROM, however, continues to make it attractive to users.

In response to this limitation of not being able
15 to write to optical compact discs, technology was developed to try to make optical compact discs more like magnetic compact discs. These compact discs have the ability to read and write information to the discs and are often called writeable compact discs or CD-Rs
20 or CD-RWs. Other hybrid formats have been developed which allow both ROM type qualities and reading and writing qualities on the same disc. An example of such a hybrid disc can be seen in U.S. Patent No. 5,204,852 by Nakagawa et al. titled "*Optical Disc-Like Recoding*
25 *Medium And Manufacturing Method Thereof.*" Such CDRs, CD-RWs, and hybrids, however, can be difficult and expensive to manufacture, have a very small user base, the writers for the format are not yet commonplace, and in some instances provide a much greater reduction in
30 storage and read/writing capacity than the conventional optical compact discs.

Also, in response to this limitation of not being able to write to an optical compact disc, many companies attempted to develop optical compact discs
35 with integrated circuits associated therewith or a magnetic strip associated therewith. Examples of such compact discs can be seen in U.S. Patent No. 5,465,381

by Schmidt et al. titled "Processor And Read/Write Head Incorporated In Disk For Communicating Data To Host Directly From Processor Read/Write Head To Read/Write Head of Host Disk Drive" and U.S. Patent No. 5,652,838

5 by Lovett titled "Smart Disc CD-ROM." The problem with such new developments, however, is that such custom type of compact discs require a special or custom reader. The current user base has a conventional compact disc reader. In other words, computer or other
10 hardware manufacturers would have to adopt a new type of reader and this is not being done. Much of this lack of adopting a new reader may be uncertainty over the new format of the storing and reading media. These custom compacts discs having integrated circuits
15 associated therewith also are more expensive to manufacture and quality and other manufacturing, distributing, reading, and writing problems can occur more readily as well.

Other formats of storing information such as
20 digital video discs ("DVDs") have been developed as well. DVDs are another format for compact discs which provide enhanced formatting and view of digital video. This technology, however, is in many ways only an extension of the CD-ROM technology. Although starting
25 to become more widespread, this technology also requires a separate or new computer drive for users.

Additionally, global communications networks, such as the Internet, have been developed so that their use has become much more widespread. A global
30 communications network advantageously allows users throughout the world to communicate via computer network links. One company, Iora Inc. of Burlingame, California and Iora Ltd. of Basingstoke, Hampshire, United Kingdom, along with Novell, Inc. of Orem, Utah,
35 has developed a file comparison and replication technology, e.g., SoftCD, which allows compact disc

information to be updated through a communications network such as the Internet. Examples of some of the patents related to updating compact discs through the Internet can be seen in U.S. Patent No. 5,991,771 by Falls et al. titled *"Transaction Synchronization In A Disconnectable Computer And Network,"* U.S. Patent No. 5,950,198 by Falls et al. titled *"Processes And Apparatuses For Generating File Correspondency Through Replication And Synchronization Between Target And Source Computers,"* U.S. Patent No. 5,924,096 by Draper et al. titled *"Distributed Database Using Indexed Into Tags To Tracks Events According To Type, Update Cache, Create Virtual Update Log On Demand,"* and U.S. Patent No. 5,878,434 by Draper et al. titled *"Transaction Clash Management In A Disconnectable Computer And Network."* This technology allows a user to insert an optical compact disc into a disc drive and have the compact disc periodically updated through the Internet by writing information to a hard drive or other memory of the user's computer instead of the disc itself. This advantageously allows the user to purchase and use a compact disc and yet have the information on the compact disc to become stale or obsolete.

It was originally thought by many that the Internet would greatly reduce or destroy the CD-ROM market. Instead, large computer and software companies and Internet Service Providers ("ISPs") have distributed millions and millions of CD-ROMs. Although this technology of updating compact discs through a global communications network such as the Internet is helpful, there is still a need for a more flexible, user friendly, and complete systems or methods for updating compact discs.

35

Summary of the Invention

With the foregoing in mind, the present invention advantageously provides a system and method for updating compact discs which is more flexible and user friendly. The present invention also advantageously provides a system and method for updating compact discs which allows users of the discs to more readily, easily, and quickly update the information or data on the disc. The present invention advantageously recognizes that compact disc technology is a tremendous asset to the expansive use of a global communications network such as the Internet because this technology provides the support, the log on mechanism, the bulk data, video and multimedia content that the Internet finds hard or even impossible to deliver by itself. The present invention also recognizes that compact disc technology is complimentary to the Internet and takes advantage of this recognition by providing a graphical user interface that enhances updating of compact discs through a global communications network such as the Internet. The present invention further provides a system and method of updating compact discs which does not require major new investments in existing computer machinery because the user base already exists. Even still, the present invention still takes advantage of changing technology to provide flexible adaptation to other information delivery formats such as CD-R, CD-RW, hybrid, DVD, and other formats as understood by those skilled in the art.

More particularly, a system and method for updating a compact disc is provided which preferably has a computer having software stored thereon defining a server. The server has first compact disc updating software associated therewith for storing compact disc update data. A communications network is preferably positioned in communication with the server, and a plurality of remote computers are preferably in communication with the server through the

communications network. Each of the plurality of remote computers preferably includes a processor for processing digital data, a memory in communication with the processor for storing digital data, a user display
5 in communication with the processor for displaying data to a user, and a compact disc drive positioned to receive at least one compact disc therein. A compact disc is positioned in the compact disc drive of at least one of the remote computers and is capable of
10 storing digital data thereon. The compact disc preferably includes a seating ring interface seat associated with the compact disc, second disc updating software stored on the compact disc and in communication with the first compact disc updating
15 software for updating digital data stored on compact disc by storing the updated data in the memory of the at least one remote computer so that the update appears to the user to be on the compact disc. A graphical user interface is stored on the compact disc for
20 producing a graphical user interface for display on the users display of the at least one remote computer to enhance and speed up user update capabilities to the compact disc.

The present invention also provides a graphical
25 user interface which enhances and speeds up update capabilities to a user of the compact disc. The graphical user interface preferably has interface displaying means for displaying a graphical user interface on a user display of a remote computer and
30 directing means for graphically directing a user through a plurality of blocks for updating stored digital data in memory of at least one remote computer so that the update appears to the user to be on a compact disc. The directing means preferably includes
35 software loading means displayed to a user for loading disc updating software into the memory of the at least one remote computer responsive to the user. The

graphical user interface also preferably has update
initiating means associated with the disc updating
software for initiating the updating of the updated
data from remote disc updating software, e.g., disc
5 updating software on a server.

The graphical user interface of the present
invention advantageously automates the process of
updating a compact disc and informs the user of the
blocks required for such automated update. In turn,
10 the user friendly interface enhances the update
capabilities and provides a seamless interface between
users and updating functions.

The present invention further provides a method of
updating a compact disc. The method preferably
15 includes providing first compact disc updating software
associated with a computer defining a server for
storing compact disc update data and positioning a
compact disc in a compact disc drive of at least one
remote computer capable of storing digital data
20 thereon. The compact disc preferably includes a
seating ring interface seat associated with the compact
disc. The method also preferably includes providing
second disc updating software stored on the compact
disc and in communication with the first compact disc
25 updating software through a communication link,
updating digital data stored on the compact disc by
storing the updated data in the memory of the at least
one remote computer, and producing a graphical user
interface to enhance update capabilities to a user of
30 the compact disc.

The method can also include directing a user
through a plurality of blocks by the graphical user
interface on a display of the at least one remote
computer to thereby update stored digital data in
35 memory of the at least one remote computer so that the
update appears to the user to be on a compact disc,
loading disc updating software into the memory of the

at least one remote computer responsive to the user,
and initiating the updating of the updated data from
remote disc updating software.

The present invention is particularly advantageous
5 in use with a communication network such as the
Internet or an Intranet because the Internet, for
example, has become widely used for communication,
information distribution, training, and other
functions. Because the information or data used for
10 these purposes or function can change, the present
invention greatly reduces or limits the need for static
information such as provided in the conventional CD-ROM
format. Also, because the distribution of information
is quicker, when CD-ROMs or other related technologies
15 as described in the background are distributed to
users, the content information, e.g., a price, a new
product, a news item, an important specification, a
delivery schedule, a product recall, a health or safety
update, legislation, statistical, or other information,
20 may have changed or may change shortly thereafter.
Because users are already using CD-ROMs and are
familiar with their format, the users also
advantageously do not need to be re-educated or re-
trained on other formats to use the present invention.

25

Brief Description of the Drawings

Some of the features, advantages, and benefits of
the present invention having been stated, others will
30 become apparent as the description proceeds when taken
in conjunction with the accompanying drawings in which:

FIG. 1 is an environmental perspective view of a
system for updating a compact disc and showing a user
updating a compact disc according to the present
35 invention;

FIG. 2 is a schematic perspective view of a
compact disc having disc updating software stored

thereon according to the present invention;

FIG. 3 is a fragmentary perspective view of a user loading a compact disc onto a disc loading tray of a system for updating a compact disc according to the present invention;

FIG. 4 is a front elevational view of a first display screen of a graphical user interface of a system for updating compact discs according to the present invention;

FIG. 5 is a front elevational view of a second display screen of a graphical user interface of a system for updating compact discs according to the present invention;

FIG. 6 is a front elevational view of a third display screen of a graphical user interface of a system for updating compact discs according to the present invention;

FIG. 7 is a front elevational view of a fourth display screen of a graphical user interface of a system for updating compact discs according to the present invention;

FIGS. 8A-8B are schematic flow diagrams of a method of updating a compact disc according to the prior art;

FIGS. 9A-9B are schematic flow diagrams of a method of updating a compact disc according to the present invention; and

FIG. 10 is a schematic diagram of a graphical user interface stored on a compact disc of a system for updating compact discs according to the present invention.

Detailed Description of Preferred Embodiments

The present invention will now be described more fully hereinafter with reference to the accompanying drawings which illustrate preferred embodiments of the invention. This invention may, however, be embodied in

many different forms and should not be construed as limited to the embodiments set forth herein. Rather, these embodiments are provided so that this disclosure will be thorough and complete, and will fully convey the scope of the invention to those skilled in the art. Like numbers refer to like elements throughout, the prime notation, if used, indicates similar elements in alternative embodiments.

FIGS. 1 and 3 illustrate a user updating a compact disc through a global communications network 12, e.g., the Internet, by the use of a system 15 for updating the same. Although this description is in the context of the Internet, other communication networks 12, e.g., Intranet, can be used as well according to the present invention. The compact disc 30 is preferably an optical compact disc, as understood by those skilled in the art, having about 600-700 Megabytes (Mb) of storage capacity without compressing the data or without adopting a DVD format, other format, or other type of compact disc reader 22. As understood by those skilled in the art, and even though for brevity the description herein is in the context of conventional optical compact discs, e.g., CD-ROM, the present invention is also applicable to CD-R, CD-RW, hybrid, and DVD formats as well as the optical compact disc or CD-ROM format. The updating capability is preferably as defined by SoftCD, namely SoftCD Client and/or SoftCD Publisher by Iora Ltd. or Iora Inc., and more preferably by SoftCD (Version 2.0 or higher) which is also incorporated herein by reference in its entirety. The present invention preferably operates in tandem with or as an improvement to SoftCD to provide an enhanced system 15 and methods for updating compact discs.

According to the present invention, a CD-ROM disc 30, for example, is preferably manufactured and

distributed to the end user. The CD-ROM disc 30 preferably contains two aspects. First, the disc 30 has disc updating means in the form of intelligent software that enables the user to receive updates to
5 any updatable compact disc 30 so that once the user's computer 20 is enabled the user can receive updates to any updatable compact disc 30 (see FIG. 2). As understood by those skilled in the art, the user's computer 20 preferably includes a processor 21 for
10 processing digital data, a memory, e.g., within hard drive 25, in communication with the processor 21 for storing digital data, a user display 23 for displaying graphical data to a user, and a compact disc driver or reader 22 in communication with the processor 21 for
15 reading data from a compact disc when positioned therein. The compact disc drive 22 also preferably includes a loading tray or device 28 for loading the disc to the reader 22. Second, a link from the updatable compact disc 30 to an Internet server or
20 computer having software loaded thereon which defines a server 16 (see FIGS. 1-2). This is the location where the updatable compact disc 30 can responsively retrieve updates or amendments in the future.

According to the present invention, it will be
25 understood that the information that is transmitted to the hard drive 25 or other storage medium of the computer 20 of a disc user is preferably only the differences between the original content 31 of the compact disc 30 and the amendment 35 or updates. This
30 greatly reduces the amount of information sent and greatly increases the speed of providing updates to users. Therefore, this is where SoftCD software, e.g., a file comparison and replication technology, can

advantageously be used according to the present invention.

This SoftCD software can advantageously be used because it makes such a comparison at a low level so that is it only looking for actual changes in digital information, not whole files, documents, or programs. This software also advantageously does not need to know what the data is, e.g., it could be video, music, web pages, word documents, or other data types. The changes, in essence, are usually substantially insignificant to the whole original content of the compact disc 30. Once the software collates the changes, the software compresses the data to be changed to be even more efficient, and creates an amendment file. An amendment file 32 is the physical differences between the original content 31 of the compact disc 30 and the new data. Therefore, any download of these changes is insignificant and very quick in comparison to traditional methods.

As understood by those skilled in the art, SoftCD software preferably has SoftCD Client 36 and SoftCD Publisher 38. The SoftCD Publisher 38 is preferably resident on the computer or server 16 or 18 of the company or individual trying to create the update of the content of the compact disc 30. The "Client" software 36 is an executable installer which installs the "Client" software 36 onto a user's computer 20, e.g., hard drive 25. This software is currently for Microsoft Windows Users only (Windows 95, 98, 2000, and NT). This installer is approximately 3.0 Mb as an executable file (SoftCD Client 36). When installed on a Windows based computer or machine, the software allows for the manageability and updating of a publication. SoftCD Client 36 then becomes active in the Windows environment (API) as understood by those

skilled in the art. SoftCD Client 36 is now able to recognize an update to a publication when received and apply it. SoftCD Publisher 38, in turn, is an executable installer which installs "Publisher" software onto a machine or computer which creates the update or amendment. This software is also currently for Microsoft Windows Users only (Windows 95, 98, 2000, and NT). This installer is approximately 3.0 Mb as an executable file (SoftCD Publisher 38). When installed on Windows based computers or machines, the software allows the creation of "Amendment Files" 32 and the manageability of a publication(s).

SoftCD Publisher 38 also creates a "Link File" 33 which is a text based file which contains information or data that tells SoftCD Client 38 where to find an "Amendment File." For example, "location of the amendment index is at:
<http://www.igrom.com/amendments/publication>] or A:/amendments/publication] (on a floppy or magnetic disc) or a combination of locations. An "Index File" 34 tells SoftCD Client 36 which is the correct "Amendment File" 32 and how many amendments 32 there are or that have been created.

An "Amendment File" 32 is a file created by SoftCD Publisher 38 as described above and which contains the differences between versions of a "publication." The publication is the content of a compact disc 30. Amendment Files 32 are specific to a particular publication and can also run consecutively. This Amendment File 32 is created by SoftCD Publisher 38 when SoftCD Publisher 38 is asked to compare an original updatable compact disc content 31 with a newer version of the content 32. This is normally held on the Publisher's (computer or server 16 or 18) hard disc

drive. When the Amendment File 32 is created, it must be located at the location specified by the Link File 33. This is normally an FTP location on a web server, but is not limited to a web server. It could be a floppy disc, CD-ROM, hard disc drive location, e-mail attachment, web page, or server on an Intranet.

As shown in FIGS. 8A-8B, the following blocks 50, for example, illustrate how this update occurs. First (or after start 51), an original updatable compact disc 30 (one which has been manufactured) or a CD-R "Gold Master" (a Gold Master is the original data to be manufactured onto an updatable compact disc and which should be identical to the manufactured updatable compact disc 30 when produced) is placed in a CD-ROM drive of the Publisher or Computer 16 or 18 making the amendment 52 (see FIG. 1). The updatable compact disc or Gold Master should also contain a Link File 33 and SoftCD Client 36 (see FIG. 2). Second, the Publisher computer runs SoftCD Publisher 38 (see block 53 of FIG. 8A).

Third, SoftCD Publisher 38 needs to know the content of the updatable compact disc 30 as a reference (to establish the "base content" (the "base content" is the original data 31 which is desired to be changed or amended)) 54. This can be any part, or the entire contents of an updatable compact disc 30, but often are the entire contents of such a disc including a Link File 33 and SoftCD Client 36 (the main root directory and all files from it).

Then fourth, this base content 31 becomes a single publication and is given a reference name by the user 55. This reference name is used by SoftCD Client 36 to apply an "amendment" 32 and to differentiate it from

other "publications" after amendment, index, and link files are created 56. Fifth, the Publisher also states how the "amendment" is to be applied which is indicated by the Link File 57. For example, "apply amendment to
5 entire contents `base content' which can be found from an FTP location at
<http://www.igrom.com/amendments/publication1> only. This will limit the amendment file to being applied only from that location and only to the CD-ROM drive.
10 Sixth, the Publisher also determines any restrictions on how the amendment can be applied 57.

Once the publication is created it will in turn create three files, namely an "Index File" 34, an
"Amendment File" 32, and a "Link File" 35. The Index
15 File 34 should be posted to the location specified by the Link File 33. It should be the correct Index File 34 relating to the latest version of amendments. The Amendment File 32 should also be in the location specified by the Link File 33. The Link File 33 should
20 be on the original Gold Master and all manufactured updatable compact discs 30. The amendment 32 can then be communicated to the server 16 or the publisher computer can act as a server 18 for sending updates 58 to a user's computer 20 (see FIG. 1).

25 The user places an updatable disc in the disc drive 22 of the user's computer 20 (see step 59 of FIG. 8B), and the user manually installs and runs SoftCD Client 36 on the user's computer through searching and locating files from the disc 30 and using a series of
30 commands 61. These steps are often difficult, especially with respect to the skill level of an average user, and often takes extensive computer knowledge to complete. A comparison is made between user's version and publisher's version of SoftCD

Publisher 62. An error occurs if the version does not match 63. The user then is required to locate the amendment file 32 (step 64). Also, if the name of the publication already exists on user's computer, no amendment would be applied 65. Otherwise, the disc is updated, and the user can use the new update material 66.

Some needs and/or problems, however, still exist with the current SoftCD process. For example, the user of an updatable compact discs 30 does not know how the updating process works. Also, SoftCD Client 36 must be installed on the user's computer 20 or machine, and it must be the correct version to match the "Publication" version. In other words, SoftCD Client 36 cannot be a lesser version than the Publication. Otherwise, errors will occur, and the amendment 32 will not apply. Additionally, the Link File 33 must be executed to locate the "Amendment Files" 32. The user must be informed of its existence and activate the execution of the file with a mouse or other command. This cannot be done while running a presentation.

Further, versions of Windows cannot update or change open files. Therefore a user cannot update the content that is open, and the user cannot apply an amendment to it. Also, Unix web servers do not understand the "+" sign which some versions of SoftCD Publisher creates as a tag to the Amendment File 32. For example, Publication1 +1.orl (the name of the "Amendment File"). The Amendment File 32 could be stored on a Unix Web Server (and will not be located). Further still, the name of the Publication already exists on the users machine (in SoftCD Client Manager) yet it is not the same publication. This will not apply an update. Finally, the whole process is

complicated and prone to user error or unacceptability by the user to perform the required blocks.

Accordingly, the present invention advantageously addresses these problems by enhancing the background
5 updating process to greatly reduce or alleviate user error or unacceptability by the user to perform the required updating blocks. The updating process 70 as shown in blocks or steps 71-78 of FIG. 9A, are similar to those in FIG. 8A. The blocks in FIG. 9B, however
10 are significantly different. The present invention also enhances the removal of an "amendment" or "publication" before applying a new one to the same "publication." This advantageously avoids incremental updates and enables more uses of the updatable function
15 and individual user-tailored applications. The present invention also provides a process for enhancing the version update of SoftCD Client 36 within a user interface 40 via a communications network 12 such as the Internet for user with older incompatible versions
20 of SoftCD Client 36. The present invention also enhances the ability to provide multiple publications and amendments 32 (yet none conflicting) to the same original updatable compact discs 30 and the ability to manage different data for different users to be able to
25 tailor the data for individual user groups, e.g., via a menu, a web server, or password system.

The present invention further advantageously provides the ability to locate Amendment Files 32 within a web page to enable download via any web
30 browser by providing a web browser plug-in based interface which can be used to seamlessly apply amendments 32 while on-line, and with an offline "automatic" launch if desired. As understood by those skilled in the art, the present invention still further
35 provides management or control of how often to check

(time, date, frequency) for new amendments 32 or updates so that the user does not have to remember to check. The system 15 can provide password protection which can be linked to different publications and amendment files, restriction of access to unauthorized users of amendment files, and the ability to readily unlock encrypted versions of SoftCD when desired or allowed.

In essence, as shown in FIGS. 4-7 and 9A-9B, the system 15 of the present invention provides a graphical user interface 40 independent of SoftCD Client 36 which enhances the user updating process and informs the user of the blocks required. The system 15 checks the users machine 20 to establish if SoftCD Client 36 is installed and that it is the correct version. If not, then the correct version can then be installed from the updatable compact discs 30. The Link File 33 can be executed with the graphical user interface 40 or within the contents of the updatable compact discs 30. This can be done responsive to loading, some other event, or by informing the user to press a button. This would then launch the Link File 33. The system 15 provides an independent user interface 40 the content of which does not change and is not affected by the updating functions so that problems with the user can be greatly reduced or avoided. By changing the Windows registry entries on the publisher's machine, the system 15 replaces the "+" sign with a "-" sign which Unix servers can interpret.

Preferably, as shown in FIG. 2, SoftCD Client 36 and the specific "Link File" 33 are distributed on the updatable compact disc 30 in an executable format (installer), and SoftCD Publisher is not distributed to the user. After the disc is loaded into a user's disc

drive 79, the graphical user interface 40 preferably provides an automatic run facility or location which launches a multimedia generating language 81, as

understood by those skilled in the art, such as a
5 Macromedia Director Application by Macromedia, Inc. of San Francisco, California, which contains the user interface 40 to do the following:

- (1) Inform the user of the process of updating the compact disc 30 (blocks 82-83); (2) Install SoftCD
- 10 Client 36 without having to locate it on the compact disc 30 (block 84); (3) Launch the Link File 33 without having to locate it on the compact disc 30 (block 85);
- (4) Provide a seamless interface between the users content and SoftCD functions; (5) Launch an independent
- 15 Macromedia Director "Movie" file from within a Director Projector which does not need to be updated and therefore does not interfere with the Windows open file problem (block 86); (6) By running a third party Xtra from within Macromedia Director to access the windows
- 20 API to search for, locate, and launch the Link File 33; and (7) By running a third party Xtra from within Macromedia Director to access the windows API to search for, locate, and launch the SoftCD Client 36. The user can then readily choose to update the disc content
- 25 (block 87), and the amendment file 32 is applied to the base contents within restrictions provided or associated with the disc size and shape. A seamless interface for updating discs is then provided.

The graphic user interface 40, for example, can be
30 written in C++ programming language as understood by those skilled in the art to launch an independent application which opens and closes responsively to eliminate the Windows open file problem and the Macromedia Director Projectors inability to be updated
35 when open. By using a C++ application, for example, to

change the Windows registry settings, from "+" to "-" eliminates the Unix web server problem. The system 15 is preferably provided by the use of Macromedia Director 6.5 or higher, as understood by those skilled in the art and which is incorporated herein by reference in its entirety, Buddy API Xtra's for Macromedia Director, and C++ programming language. It will be understood by those skilled in the art, however, that additional external programming in a development language like C++, Visual Basic, HTML, or Java to operate stand-alone can be used as well. These form the basis of a set of programmable tools to tailor the user interface 40 of the system 15 for particular client applications and to eliminate problems associated with files, sizes, and types.

As perhaps best shown in FIGS. 4-7 and 10, the graphical user interface ("GUI") 40 preferably includes an interface display, such as user display generator 42, responsive to user interaction, e.g., clicking of mouse or keyboard stroke, which displays or launches a display of the graphical user interface on the user display of a computer. The GUI 40 also preferably includes a user director 45 which visually directs a user through a plurality of blocks, e.g., see FIGS. 4-6, for updating the stored digital data in the memory of the computer 20 so that the update appears to be on the disc 30. The user director 45, preferably a software loader, is positioned to load the disc updating software on the disc 30 into the memory of the computer 20. The GUI 40 can also include a user update initiator 48 for initiating the updating of the disc responsive to user interaction with the GUI 40. These portions of the GUI 40 are preferably provided by software modules, as understood by those skilled in the art, stored on the disc 30.

As illustrated in FIGS. 1-10, and more particularly perhaps FIGS. 9A-9B, a method of updating a compact disc 30 is provided. The method preferably includes providing first compact disc updating software associated with a computer 16 or 18 defining a server for storing compact disc update data and positioning a compact disc 30 in a compact disc drive 22 of at least one remote computer 20 capable of storing digital data thereon 79. The compact disc 30 preferably includes a seating ring interface seat 35 associated with the compact disc 30. The method also preferably includes providing second disc updating software stored on the compact disc 30 and in communication with the first compact disc updating software through a communication link 12, updating digital data stored on the compact disc 30 by storing the updated data in the memory of the at least one remote computer 20, and producing a graphical user interface 40 to enhance and speed up or quicken update capabilities to a user of the compact disc 30.

The method can also include directing a user through a plurality of blocks by the graphical user interface 40 to thereby update stored digital data in memory of the at least one remote computer 20 so that the update appears to the user to be on a compact disc 30, loading disc updating software into the memory of the at least one remote computer 20 responsive to the user, and initiating the updating of the updated data from remote disc updating software.

In the drawings and specification, there have been disclosed a typical preferred embodiment of the invention, and although specific terms are employed, the terms are used in a descriptive sense only and not for purposes of limitation. The invention has been

described in considerable detail with specific
reference to these illustrated embodiments. It will be
apparent, however, that various modifications and
changes can be made within the spirit and scope of the
5 invention as described in the foregoing specification
and as defined in the appended claims.
